

Taiga King UI vs

Removable Components

Notes functionality (and all accompanying UI components) can be removed completely as this has no relevance to ScrumBoard analysis

- Since this entire program will be read only there's no real purpose for this

Agenda can be removed completely as Tasks/Events do not have the same meaning in this context and providing this view of those things isn't beneficial

- Because of the nested structure of this data (Tasks belong to User Stories which belong to Sprints which belong to Projects) there's no need for something like this

Resources can be removed completely as nothing of this nature is required for ScrumBoard analysis

- Again, read only

Adjustable Components

Events as they currently exist can be re-used as 'timeline' entries like we see on Slack.

- Create/edit/delete event functionality does not need to be supported by the new UI.
- All functionality related to reminders for these events can be removed.
- Events will need to be associated with Sprints, Tasks, and User Stories

Memoranda Task menu can be repurposed as a display for User Story & Task data

- Create/edit/delete task functionality does not need to be supported by the new UI.
- New attributes for tasks will need to be included in the display and status options will need to be adjusted
- New menu will display US/tasks in a tree structure
- Analytics option will be listed on the side of this menu allowing the options laid out in item 3E of docs/US#19/UICoreRequirements.pdf
- Clicking a UserStory/task displays basic details associated with that US/task.
- Should have an options menu where you can parse what you want to display by collaborator/status/time/name/etc...

Navigation bar on left-hand side of screen can be adjusted to support the following:

- Once in a project's scope, provide some of the same options Taiga does
 - Collaborators
 - Timeline
 - Backlog (this would be the sprint menu)

Existing dropdown menus on top should be able to support the following functionality:

- Change user (redirect to login menu defined in New Components)
- Change project (redirect to project menu defined in New Components)

New Components

A login menu will need to be visible on startup so people can enter their API credentials for Taiga.

- Username / password / key (whatever is needed to make API requests)
- Forgot? Redirects to taigas forgot

- No account? Redirects to taigas create account

A project menu will need to be added, providing a high level rundown of the project's status/outcome.

- Display basic details like name, start / completion date, and number of sprints
- Display a list of collaborators/participants
- Clicking a project takes you to the sprint submenu

A sprint submenu will need to be added, providing a high level rundown of all of a project's sprints and their status/outcome.

- Display basic details like Tasks In Progress / Completed.
- Display a list of collaborators.
- Clicking a sprint takes you to UserStory/Task tree
